Re: Louisa Scarr née Roupell ; dob 22nd June 1960

By Email only

To whom it may Concern

Dear Sir or Madam

I was referred Louisa by Mr Richard Cohen, who had previously operated on Mrs Scarr and was worried that she may be at risk of developing invasive infections subsequent to his surgical intervention, especially in view of her carriage of a multidrug resistant Gram negative organism. At the time, it was my opinion that she was indeed at greater risk than healthier people and advised her accordingly to minimize her chances of infection.

Since then, she has unfortunately suffered from further ill health, needing treatment (including radiotherapy) for breast cancer as well as now also suffering from advanced chronic kidney disease.

As a physician with a qualification in Cellular immunology, and dealing on a daily basis with immunosuppressed individuals and the consequences thereof, I consider Louisa to be far more at risk of serious infection than a healthy adult of her age.

Furthermore, these infections may not only be bacterial, but also fungal. The former will likely be by contact, and the latter by inhalation of mould spores. The latter may also trigger hypersensitivity reactions, with shortness of breath and wheezing.

I have been made aware of Mrs Scarr's issues with flooding by sewage. The latter is one of the richest sources of both bacteria and moulds known to Man. Furthermore, any remaining elements of dampness will hugely increase mould numbers, which then become airborne and present a threat to health.

It is my opinion that it is very important for the preservation of Mrs Scarr's future health to make every effort to reverse the totality of the sewage-related damage to truly reduce her risk of infection from this sewage incident. This should include double deep

cleaning to hospital standards as well as replacement of any fabrics, which were left damp and contaminated by the sewage. It is essentially impossible to restore these to a point where they will not act as potential sources of airborne fungus and mould, once soaked and contaminated.

I do hope this is useful and informative.

Yours faithfully

Dr A R I A Gant FRCP FRCPath PhD
